BASIC ABSTRACT:

WO 9526407 A UPAB: 19951114

Transformed potato plants or their progeny capable of giving rise to tubers having altered starch, comprising at least an effective portion of a starch branching enzyme (SBE) cDNA operably linked in the antisense orientation to a suitable promoter, such that the level of SBE is limited to less than 0.8 units per gram of tuber, are claimed. Also claimed are: (1) a vector for modifying a potato plant so as to cause the plant to be capable of giving rise to tubers having less than 0.8 units of SBE activity per gram of tuber, the vector comprising at least an effective portion of a SBE cDNA operably linked in the antisense orientation to a suitable promoter; (2) altered starch extracted from transformed potato plants or their progeny, the plants having less than 0.8 units SBE activity per gram of tuber, where the extracted starch has the following physical properties: (i) an elevated peak temp. of gelatinisation (detd. by differential scanning calorimetry (DSC)), relative to unaltered starch extracted from equivalent non-transformed plants; and (ii) an elevated viscosity onset temp., relative to unaltered starch extracted from equivalent non-transformed plants.

USE - The starches can be used in food and non-food (e.g. paper, textiles and adhesives) applications.

ADVANTAGE - The plants have low levels of SBE activity, and produce starches with elevated peak temps. of gelatinisation and viscosity onset.

ABSTRACT:

Disclosed is a method of producing altered starch from transformed potato plants or their progeny, comprising extg. starch from a potato plant, at least the tubers of which comprise at least an effective portion of a starch branching enzyme (SBE) cDNA sequence operably linked in the antisense orientation to a suitable promoter, such that the level of SBE activity is limited to less than 0.8 units per g tuber. Also disclosed are potato plants comprising altered starch in accordance with the invention.
